

Patent Claims

1. A layer system (1),
at least comprising a substrate (4) and
5 an at least partially porous layer (10) on the substrate
(4),
a pore (25) in the porous layer (10) in each case being
delimited by pore walls (22),
which (22) in some cases adjoin a surface (9, 14) of the
10 substrate (4),

characterized in that

the pore walls (22)
15 which adjoin the surface (9, 14)
have a larger cross-sectional area in the region of the
surface (9, 14) of the substrate (4) than the pore walls
(22)
which do not adjoin the region of the surface (9, 14),
20 resulting in improved mechanical bonding of the pore walls
(22) to the substrate (4).

2. The layer system as claimed in claim 1,
characterized

25 in that the surface (9) of the substrate (4) of the layer
system (1) adjoins a region (110, 111)
which is exposed to a hot medium, and
in that the porous layer (10) is formed on the opposite
30 surface (14) of the substrate (4) from the surface (9).

3. The layer system as claimed in claim 1 or 2,
characterized

35 in that the surface (9) of the substrate (4) of the layer
system (1) can be exposed to a hot medium

which is present in a region (110, 111), and
in that the porous layer (10) is formed on the surface (9)
of the substrate (4).

- 5 4. The layer system as claimed in claim 1, 2 or 3,
characterized

10 in that the contact zones between layer (10) and substrate
 (4) at the surface (9, 14) are in each case formed by a
 wall section surface (19), and
 in that the size of the wall section surface (19) at the
 surface (9, 14) is larger than the wall section surfaces
 (19) which do not adjoin the region of the surface (9,
15 14),
 resulting in improved mechanical bonding of the wall
 section surface (19) to the substrate (4).

20 5. The layer system as claimed in claim 1 or 4,
 characterized in that
 a contact surface between the pore walls (22) and/or the
 wall section surfaces (19) and the substrate (4) forms at
 least 10% of the surface (9, 14) of the substrate (4)
 which is covered by the porous layer (10).

25 6. The layer system as claimed in claim 1 or 5,
 characterized in that
 the thickness of the pore walls (22) varies,
30 in particular in a radial direction (11),
 running perpendicular to the surface of the substrate (4).

35 7. The layer system as claimed in claim 6,
 characterized in that

the thickness of the pore walls (22) has a gradient along the radial direction (11).

- 5 8. The layer system as claimed in claim 6 or 7,
characterized in that

the thickness of the pore walls (22) is greater in the vicinity of the substrate (4).

- 10 9. The layer system as claimed in claim 6 or 7,
characterized in that

15 the thickness of the pore walls (22) is designed to increase starting from the substrate (4) toward the outer surface (16) of the porous layer (10).

10. The layer system as claimed in claim 1, 6, 7, 8 or 9,
characterized

20 in that a radial direction (11) extends from the substrate (4) toward the outer surface (16) of the layer system (1),
and
in that the pore sizes (28) of the pores (25) have a gradient along the radial direction (11).

- 25 11. The layer system as claimed in claim 10,
characterized in that

30 the pore size (28) is smaller in the vicinity of the substrate (4) than in the vicinity of the outer surface (16) of the porous layer (10).

12. The layer system as claimed in claim 1,
characterized in that

35

edges of pore walls (22) or of passages (26) in the pore walls (22) are at least partially rounded.

13. The layer system as claimed in claim 1,
5 characterized in that

the porous layer (10) has a honeycomb structure.

14. The layer system as claimed in claim 1,
10 characterized in that

the porous layer (10) has a structure through which a cooling medium can at least partially flow.

15 15. The layer system as claimed in claim 1,
characterized in that

20 the porous layer (10) has at least one protective layer (12) at least in the region of the outer surface (16) of the layer (10).

16. The layer system as claimed in claim 1 or 15,
characterized in that

25 at least one protective layer (12) is applied within the porous layer (10) at least in the region of the outer surface (16).

17. The layer system as claimed in claim 1 or 15,
30 characterized in that

at least one protective layer (12) is applied to the surface (16) of the porous layer (10).

35 18. The layer system as claimed in claim 15, 16 or 17,
characterized in that

the at least one protective layer (12) is metallic or ceramic.

- 5 19. The layer system as claimed in claim 15, 16, 17 or 18, characterized

in that the porous layer (10) is metallic, and
in that the protective layer (12) is ceramic.

10

20. The layer system as claimed in claim 1, characterized in that

15

the layer system (1) is a gas or steam turbine component, in particular a turbine blade or vane (120, 130) or a combustion chamber lining (155).

21. The layer system as claimed in claim 1 or 20, characterized in that

20

the substrate (4) is metallic, in particular an iron-base, nickel-base or cobalt-base superalloy.

- 25 22. The layer system as claimed in claim 1 or 18, characterized in that

the porous layer (10) is ceramic in form.

- 30 23. The layer system as claimed in claim 1, characterized in that

35

the porous layer (10) is metallic, in particular has the composition of an MCrAlX composition, where M stands for at least one element selected from the group consisting of iron, cobalt or nickel,

and X is yttrium and/or at least one rare earth element.

24. The layer system as claimed in claim 1, 22 or 23,
characterized in that

5

the porous layer (10) is formed integrally with the
substrate (4).

25. The layer system as claimed in claim 1,
characterized in that

10

the layer system (1) has cooling passages (13, 26) in the
substrate (4) and/or in the pore walls (22).

26. The layer system as claimed in claim 1,
characterized in that

15

the size (28) of the pores (25) in the layer (10)
is larger than the size of foreign particles in a medium
which flows through the layer (10).

20

27. A process for producing a layer system (1) having a porous
layer (10), in particular as claimed in claim 1,
characterized in that

25

the porous layer (10) is produced in layers in a plurality
of substeps.

28. The process as claimed in claim 27,
characterized in that

30

the outer surface of the porous layer (10) is joined to
the substrate (4), in particular by soldering.

29. The process as claimed in claim 27,
characterized in that

35

stereolithography, in particular laser stereolithography,
is used
to produce the porous layer (10).

5

30. The process as claimed in claim 27 or 29,
characterized in that

10

plastic or the like is applied to the substrate (4) in
layers (10', 10", 10''') as a negative form
and is cured by means of a laser (20),
resulting in the pores (25) of the porous layer (10),
which are then surrounded, in particular by casting, with
the material of the layer (10),
so as to produce the porous layer (10).

15

31. The process as claimed in claim 27 or 29,
characterized in that

20

a model of the porous layer (10) is produced, in
particular from plastic,
and a casting mold for the porous layer (10) is produced
from this model by duplicate molding, and
in that the porous layer (10) is produced using this
casting mold.

25

32. The process as claimed in claim 27,
characterized in that

30

printing paste,
which contains material of the layer (10)
is applied to the substrate (4) in layers,
in such a way as to produce the porous layer (10) and the
pores (25).

35

33. A process for producing the layer system as claimed in claim 1,
characterized in that

5 the porous layer (10) is produced together with the substrate (4).

34. The process as claimed in claim 33,
characterized in that

10

the substrate (4) is produced together with the porous layer (10) by melt metallurgy, in particular by casting.
